I saw this happen again and more times: a new simple to use technology arrives, with its new acronym. So someone improves it, extending the acronym. Then there are another. Soon you have a confused alphabet market. So they start with the basics, Secure Digital (SD) is the current standard for removable flash storage cards in mobile devices. They are available in three physical dimensions with numerous speeds and capacity, Â (Send e-mail your technical questions to answer@pcworld.com.) A number of features rarely used justifies that s for safety. One of these, management of digital rights (DRM), is for the benefit of Hollywood, not yours. Other more consumer features include a writing protection notch (only on natural size cards) and password protection on some selected devices. As I said, they are available in three sizes: SD card cards and microSD SD cards, the original shape factor, size 32x24mm. PCs often have SD card slots in natural size. The mini SD cards measure only 21.5x20mm. These are now practically obsolete. Micro SD cards, which measure only 11x15 mm, could easily be lost through a hole in your pocket. These small cards are very popular today, especially with Android devices. Mini and Micro SD cards are often equipped with adapters that allow you to connect them in a natural size SD slot. In addition to their size, these cards are classified by standards that define their maximum capacity: standard capacity (SDSC): 2 GB maximum maximum capacity (SDHC): maximum maximum capacity (or extended) from 32 GB (SDXC): maximum 2 TB . Although I write this, you can't buy a card with a capacity of more than 128 GB .. There's another variant, Sixi (input / output). These cards, which only work in very specific devices, offer more than a simple storage. They can add GPS, Wi-Fi and other functionality to your devices. SD cards are also classified by speed, marked by a letter C (per speed class) with an inside number, which represents megabytes per second (MB / s). These speeds are often described by how much a video stream can write. The lowest evaluation, C2, can only manage the standard definition. The fastest, C10, can handle Full HD with space to save. Some high-end cards have one instead of AC. These are Ultra High Speed â €
