Install react native without android studio windows. Run react native without android studio windows. React native without android studio ubuntu. React native without android studio linux. Can we run react native without android studio. How to use react native without android studio. React native without android studio windows. Install react native without android studio.

Instantly share code, notes, and snippets. Install React Native on Windows without Android Studio You can't perform that action at this time. You signed in with another tab or window. Reload to refresh your session. You signed out in another tab or window. Reload to refresh your session. This article is about installing Android SDK in Windows system and run React Native App without Android Studio. Android SDK is required to build, run and debug Android Apps on your machine. So I needed it too to build and run React Native app for android in my windows system. But Android SDK comes with Android Studio!!! Yes, you are right but not every system can handle Android Studio :) My system is also behind the minimum system requirements so I had to go for Android SDK separately, Step 1: Install Chocolatey In the official React Native Documentation, Chocolatey is recommended for downloading Node and Java. If you already have that downloaded and configured then you can skip this step. You can either follow the complete Chocolatey Installation Doc or just run below command in your Windows Powershell Window. Set-ExecutionPolicy Bypass -Scope Process -Force; [System.Net.ServicePointManager]::SecurityProtocol = [System.Net.ServicePointManager]::SecurityProtocol -bor 3072; iex ((New-Object System.Net.WebClient).DownloadString(')) You will get Chocolatey installed and Environment Variables set. Step 2: Install Java As per the official React Native Documentation, You can use Chocolatey to install Java. If you already have that, skip this step. Just run below command in command prompt to install Node and Java. You can skip the package you have already installed. choco install -y nodejs.install openjdk8 Now you must have JAVA_HOME set in your environment variables, if not then you can set. To go to environment variable you can follow below steps: 1. Go To Properties: 2. Go to Advance System Settings 3. Go to Environment Variables 4. List of Environment Variables can be accessed here Step 3: Install SDK Manager Now firstly we need to install Android SDK Manager to install Android SDK and other tools. For that visit the official site. 1. Download sdkmanager compressed file. 2. Now you need to create a folder, where you want to keep your all SDK packages. I created C:\Android for my case. Unzip the downloaded folder in this directory. Now I'm having the folder structure as C:\Android\cmdline-tools\, 3. IMPORTANT: Now, we need to move all the unzipped files in a single folder. the name of the folder will be determined by the source.properties file's content, which is one of these unzipped files. Open this file and it'll be looked like this: Pkg.Revision=4.0 Pkg.Path=cmdline-tools;4.0 Pkg.Desc=Android SDK Command-line Tools Notice the first line, the value 4.0 is going to be our folder name. So create a folder named as 4.0 inside C:\Android\cmdline-tools\ and move all other files into this folder. So now full directory structure will be C:\Android\cmdline-tools\4.0\, 4. Now we'll set 2 Environment variables: ANDROID_HOME and Path for cmdline-tools. Set ANDROID_HOME to the path of the directory you made in above point 2, in my case it's C:\Android. Add C:\Android\cmdline-tools\4.0\bin and C:\Android\cmdline-tools\4.0 in Path Variable. Step 4: Install Android SDK packages We'll now install the required packages via sdkmanager. For that, open Command Prompt. 1. Install Platform Tools (ADB & Fastboot) Firstly we need to install adb, for that we can install platform-tools pkg via sdkmanager. Run below command or get it from here, sdkmanager "platform-tools" Now add path of platform-tools in Environment Variable Path which is C:\Android\platform-tools in my case. 2. Install Platform Use the below command to install the Android 10 (API level 30) using the SDK manager. You can download any API level by changing the name. sdkmanager "platforms;android-30" Accept T&C and it'll be installed. 3. Add System Image I am adding the most recent default 64-bit system image by running below command. Accept T&C and it'll be installed. sdkmanager "system-images;android-30;google apis;x86_64" There are some projects which need Google Play Services. We need system image specific to Google Play Services. We can add that via command as shown below. sdkmanager "system-images;android-30;google apis playstore;x86_64" 4. Install Build Tools I am adding the most recent build-tools 30.0.3 via below command. sdkmanager "build-tools;30.0.3" 5. Install Emulator (Optional) If you want to run your apps inside emulator instead of physical device then you can install emulator and system images to run that. But obviously, it requires good system specs. We'll cover this in very short, please comment if you want detailed article on that. 1. Install Emulator sdkmanager --channel=3 emulator 2. Create emulator // Create the emulator with name em30 using default system image avdmanager create avd -n em30 -k "system-images;android-30;google apis;x86_64" -g "google apis" // Create emulator with name em30ps using Google Play Services system image avdmanager create avd -n em30ps -k "system-images;android-30;google apis playstore;x86_64" This will ask many questions, answer as per your need. 3. Add emulator path in Path environment variable, in my case it's C:\Android\emulator. 4. List emulator devices installed 5. Run emulator // Run Emulator named em30 emulator -avd em30 6. How to use my device instead of emulator You can follow the official documentation here and a related troubleshooting here. I'll be adding article for my version of the same soon. So everything is set now and you'll be having Android SDK set up in your system. Below are some other related and useful commands. // list all packages available in sdkmanager sdkmanager --list // list installed packages via sdkmanager sdkmanager --list installed // Update installed packages sdkmanager --update // Uninstall packages sdkmanager --uninstall // Delete Emulator avdmanager delete avd -n Cover Photo by Denny Müller on Unsplash Certainly, before setting up a React Native development environment you follow the official facebook's getting started guide, which requires the Android Studio setup, but if you are not an Android native developer, you might want to skip its heavy installation, save some disk space, time and hack things around. How to install React Native without Android Studio:1. Install JDK82. Install node and watchman3. Download Android SDKNow instead of installing the whole Android Studio package, we will only use the Android SDK. Start by opening this android developer link, scroll to the "Command line tools only" section, and download the zip file.After downloading it, extract the zip file to the following path:4. Export the ANDROID_HOME environment variableThe React Native tools require some environment variables to be set up to build apps with native code.Instead of only exporting the ANDROID_HOME to the current session of the terminal, we make sure that it's permanently added to the terminal by adding the following lines to your \$HOME/.bash_profile or \$HOME/.bashrc (if you are using zsh then ~/.zprofile or ~/.zshrc) config file:Make sure you restart the bash to apply the changes.Also, make sure you have writing permissions to the android home folder:5. Install the required SDK packagesThe official React Native environment setup recommends installing the following SDK packages:Android SDK Platform 29Intel x86 Atom_64 System Image or Google APIs Intel x86 Atom System ImageAndroid SDK Build-Tools 29.0.2So, instead of selecting these packages from the Android Studio SDK Manager, we will install it using the command line with the following command:A very useful link is this gist, which keeps track of all the available packages, its description, and its versions.6. Install platform tools to the pathIn a later development, having the command line tools available will make everything easier, so similar to what we did to the ANDROID_HOME environment variable, we add the following lines to the \$HOME/.bash_profile or \$HOME/.bashrc (if you are using zsh then ~/.zprofile or ~/.zshrc) config file:Again, make sure to restart the bash.7. Test the installationThat's all! ☺To test if your development environment works, run:And it should work fine. Thanks for reading! I've read pretty much read every article from google search, watched all the YouTube tutorials and checked out all the StackOverflow questions relating to this but cannot find my answer. The official (but outdated) docs is not all that useful at all. I am using Windows 10. So far I have, User Variables: PATH C:\Users\RickyDam\AppData\Local\Android\android-sdk\tools C:\Users\RickyDam\AppData\Local\Android\android-sdk\platform-tools System Variables: ANDROID_HOME C:\Users\RickyDam\AppData\Local\Android\android-sdk ANDROID_SDK_HOME C:\Users\RickyDam\AppData\Local\Android\android-sdk JAVA_HOME C:\Program Files\Java\jdk1.8.0_144 PATH C:\Users\RickyDam\AppData\Local\Android\android-sdk\tools C:\Users\RickyDam\AppData\Local\Android\android-sdk\platform-tools My git bash just keeps showing bash: android: command not found And if I try to type in android.bat, it returns The "android" command is deprecated. For manual SDK, AVD, and project management, please use Android Studio. For command-line tools, use tools\bin\sdkmanager.bat and tools\bin\avdmanager.bat And then if I try to type in sdkmanager.bat, I get bash: sdkmanager.bat: command not found EDIT: I found out about the official SDK Manager installer made by Google Inc. and now my folder C:\Users\RickyDam\AppData\Local\Android\android-sdk looks like this But I still get android: command not found even though my environment variables seem to all be in place...
