Ndi hx camera apk full

The official NDIÂ® camera. Turn your phone or tablet into a live video production camera. NDIÂ® (network device interface) is a low latency IP video protocol developed in particular for the production of live video live videos and is supported by a large list of transmission systems from many manufacturers. The NDIÂ® HX camera transforms iOS imaging devices into high quality wireless A / V sources for NDI enabled transmission systems and transmission software on the same network. Your device's output is automatically recognized by video systems * NDI * enabled, ready to be mixed in live shows or even for use as a web camera if used in combination with NDIÂ® Tools (NDI.TV /TOOLS). * Note: requires support for NDI V.4 or better. Basic features Â ¢ â,¬ â ¢ easy to use Â ¢ â,¬ â ¢ iPhone and compatibility for iPad Â ¢ â,¬ â ¢ Selecting the front / rear camera Â ¢ â,¬ Â ¢ Car focus, AF block or touch to focus Â ¢ â,¬ â ¢ Automatic exposure, AE lock Â ¢ â,¬ â ¢ Manual exposure compensation Â ¢ â,¬ â ¢ Light switching on / off (on support devices) Â ¢ â,¬ ¢ Audio mute Â ¢ â,¬ ¢ Optional grid overlap Advanced features Â ¢ â,¬ â ¢ bandwidth band (up to 4K), medium (up to 1080p) and standard (640x480) Â ¢ â,¬ "â ¢ Simple pinch zooming Â ¢ â,¬ â ¢ Automatic NDI device recognition Â ¢ â,¬ ¢ Connection notification and TALLY (ON AIR / preview) Display support Â ¢ â,¬ Â ¢ base articles Knowledge Base UtfB =% E2% 9c% 93 & query = iphone & commit = Search Â ¢ â,¬ â ¢ Forum ndi https: //forums.newtek.com/forumdisplay.php/360-ndi-%28network-device-interface%29 Â ¢ â,¬ â ¢ Video HTTPS: / /www.youtube.com/watch?v=0xzujmgl3uc&t=4s ndi hx camera app reviews it's July and ndi 5 missing? Wow, Epic Failly I We buy this, but the resolution is too low, please resolve the resolution. I used this app for almost a year. I use it for film podcasts and other online events. I like to use the NDI plugins to run the OBS and use them even to transmit to enlarge. Thank you guys. It should take advantage of the wide angle lens on new iPhones. 99% of time works all the time, but it's not why this review is important. Auto-focus does not block properly, you cannot switch from various lenses on the front or rear cameras (as you can not use your wide-angle goals), the white balance is a nightmare / non-existent, you cannot correctly block 1 'Exposure and updates are very few and far between. Â,Â¯ (Âƒœ ‴) ˌ / Â ¢Â¯ would be nice to have options to select which lens to use from the wide angle to tele lens on the iPhone. It has a big problem with use for me. When I tried to use this app for streaming before it doesn't work well. The connection was not stable. Above all, this app can only use Wi-Fi the CoulndÂ ¢ â,¬ Â "¢ t using the table desk situation , please repay for me perfect ndi camera and excellent with app ndi virtual webcam. WiFi connection performance is really good on the 5 ghz band. This is very expensive for lack of functionality. The selection of frames, resolution and Camera selection must be standard options here. For the cost of this I should at least be able to use all my telephones cameras. Can I get a refund please? Don't work for me on iPhone 12 and I can only get audio On the OBS. The screen is obscur ATO. So you can't find OBS enabled in privacy and security settings. From unnecessarily unnecessarily in the matter of useless protoplasm. Competitive apps allow you to specify the resolution and FPS in the advanced settings to tune in accordance with environment. This app has a 3-way cryptic switch that does not provide much information. Furthermore there are serious problems between this app and the OBS NDI plugin that causes audio stuttering on all sources if the conditions are absolutely not a laboratory. Strongly regret the purchase. I'm going forward to get a webcam. This, along with the other NDI apps, made my life much easier for multicam streaming. Thanks! The app is horrible and continues to fade. I don't understand why it costs $ 20 for an app and give them a free trial process first. This looked like a scam. This app was fine until the last version. Last week last week has broken the small bandwidth width So bad we are looking for alternatives. We always use it to the highest setting (1080p), but now every time we start the app, returns to focus (720p), which translates into major problems downstream. The streams app Very smoothly - as usual, NDI is a great protocol of fricelli. Unfortunately, * also * the quality of actual streaming, everything else is terrible. The UI is very simple, fundamentally no characteristic. Be sincere, it is not a huge agreement for me; The point is streaming, and is good. That is really a truly serious problem, it's that I can't control which of the three cameras (wide-angle, normal, telephoto) the app uses on my iPad or iPhone. As far as I can say, you are blocked on the normal camera, period, until you update with more options. Keeping buffering is not good for live streaming not worth $ 20 if I can get a refund that I would have asked a race on 1Gigabyte internet Â ¢ â,¬ "¢ is using this every day from April. It's a solid rock stuff !! Recently, I added cameras operators - not only create 3 static shots. The operators noticed that when using this app to send video to Wirecast, the edge around the modified image. Blue connected, green in preview, red the image is live. I love it, which really helps them. There are red lids you can insert the flash on the phone because some video software can turn on the flash when the camera is live. I don't know if this would be a Wirecast function or a function of APP NDI to enable the flash. Being able to report the front of the camera that is alive would be useful to let people know with which to talk about the camera. This app has not worked and requested a resolution of complex problems to see what was wrong. Ain has no time for this! I definitely found that it is more reliable than the TC Camera app. Actually I had to switch to this during a production when my camera connection is released. Really good product and excellent quality video. Technically the app is simple and seems to work. Unfortunately on my 6 years I can only go for about 10 minutes before it overheats. I have no case on my phone and was mounted in a cradle's arm, so he had a good airflow around it. I didn't try my other iPhone because I can't risk the phone that goes off during a presentation due to overheating. Scarce performance for a great idea, I tried it with 260 Mbps in down and 29 Mbps at the top, the app is late and stammering to the point that it is absolutely not usable, I will not recommend using it to do it any streaming too much Expensive and won't deliver what they offer. It is better to buy Â ¢ â,¬ Â "Shoot -" economic and reliable "camera commissions as the connection is performed via the recording cable, I use it for 2 iPhones as cameras at the same time and works perfectly, you will get so much View on screen without worrying for performance problems, highly recommended. I literally bought this for StreamLabs OBS and late is really bad. I have solid internet and I stream on a daily basis with a nice configuration of the PC. For the price this product It should offer a USB connection to PC. For a simple wifi dependence I would not recommend buying it. Waste of $ 20. I want my money back. As not to buy. It's great, but the performance is horrible. I also have an iPhone 11 Pro, so the quality should be incredible. Literally like a delay of 2 seconds compared to my Logitech C922. I have a Mac on the internet I need I wish in Viation videos. The Mac has a real Internet address. I can't find any way to insert that address NDIHX cam. You can do it in the NDI cam, but I don't see any videos from that app. I love NDI technology on Cat5 but above without spirit is not quite stable. This is a large app for the test signal but wifi latency makes the camera and audio almost useless. I wish I could also connect via the lightning cable as the camera of the OBS will be a huge improvement but I understand that it won the NDI TECH at that point that makes it null. Ago Work with Mac starting from 20 June 20. No warning. Waste of money for Apple users. The company is difficult to contact. The new update make the accident of the app all the time I like for streaming except for the giant logo ... can I pay to remove it? Or is there a way to replace it with our logo? Thank you I used the app on an iPhone 6S and an iPhone X. It looks much better than a webcam, especially the iPhone X due to the camera. It was quite simple to connect it to the OBS; However, I had some challenges: 1) Both phones heat too much when performing the app. The iPhone 6s also issued a warning and turns off himself that I never saw doing before. Therefore this has avoided me to use this app to replace my webcam, which is why I gave three 3 stars, because it's a free app that I don't give it a lowest evaluation. 2). WiFi generates a delay between audio and video, so I had to tune it on the OBS mixer, it took several tests, but it was ok. The real problem was that the day after the delay was different, so I had to hold the settings it was annoying. There should be an option to use the cable from my phone as audio source. Once again, since the app is free I don't want to give you a lower assessment and hoping that the heating problem can be solved with an update. I want to try a different application that allows you to connect the cable as I'm just trying to replace the webcam with the iPhone 6s. Unfortunately I am not hesitant because the other apps cost money and have negative reviews. You are using this app via a dedicated local network with OBS (with the NDI plugin) we connect 3 cameras to the network via the lightning adapter to Ethernet. We use the OBS with the NDI plugin. Pro: can check the exposure and focus. It can change the audio if he failed. It can pass from a different output bandwidth. It can use the front camera. If you use the multi cam, a red box around the frame turns green. It can switch from UDP and TCP (Network Stuff) against / Wishlist: not selecting specific frame rate specifications. No selection of the specific output resolution (it is not clear) no selection of different objectives (ultra wide zoom) would be nice to be able to refuse the resolution when the origin is not used to keep the bandwidth of the network. It would be nice when using multicam to turn on the flash to show when the source is live. This could be a long blow but zoom remote control, focus, the exposure would be surprising. I would pay for the purchases of app / Pro version with these extra features. All around, it's a rather capable app, but a little more control would be clutch. One thing you need to keep in mind is that you need a strong wifi signal for your phone to send videos to your PC to make things work. Furthermore, since at this time (5/6/2020) the video format does not seem to be compatible with the zoom video conferencing app which becomes popular and widely used. If you use Skype or Microsoft application, then it seems to work well. We hope that people abundance complain and zoom will be with the program. Does not work! I hoped this would help me but nooo! Waste of $ 10! I used with an old iPhone 6 and Ecamm running on a good MacBook Pro (2012). The best results when connecting the iPhone to MacBook with Ethernet cable. It also had good results when connecting a 5G TP-Link to MacBook WiFi with Ethernet cable and have the iPhone as the only device on WiFi. I think it would be better with a modern phone but the connection is the key. I like to think of the Ethernet cable as a very cheap HDMI on a free video camera. Try this with Ecamm. I used this for streaming church services for Weeks. I just received the functioning Ethernet connection. Registered an excellent video for EcamM using an Ethernet connection for over an hour. This is a large app if used correctly. Yes, you'll need 5GHz wifi. However, it can be used on 2.4 however found optimal on 5GHz. It can also be used with Ethernet on the same network. Make sure you use appropriate drivers / software on the machine. I. I. This app. Excellent job NDI. I was using this to connect my iPhone 11 to the OBS to my Mac to record 1080p. I also intend to use this in streaming. The video recording that has come out has been beautiful and smooth for the most part. However, today the video seems to be moved. I tried to use another app called Epoccam to connect to the OBS also through NDI and the connection has been much more fluid - and there was much less latency from what I could monitor on my phone what the OBS was Monitoring - has been almost instant. The problem with Eparocam is that it was not recording audio. Although I'm registering the audio separately from the video, I use the iPhone audio to synchronize the video after recording. I'm wondering if this chopoliness was introduced due to the latest update ... My Internet speeds are well above 200 Mbps, although on wifi. I can't really explain why only two days ago the app worked much better than now. Someone from Newtek can help? Otherwise the app and functionality are fantastic. I put the wifi in modal It is low data and that has completely correct it. I use it at 1080 wide support for the iPhone 11 though. I think this is destined to Â ¢ â,¬ Â "Pro" use but it is a good solution for using an iOS device as a webcam if you need it. I just chose one for $ 22 from Amazon, and now I'm Getting the true 2160p output from the phone to my Mac Mini ... Stamps completely my GoPro Hero 8 + UltraStudio Mini Recorder 1080P Webcam Web Solution :) Warning! I spent everything in the morning looking for everything to get this to work on my Mac, only To find out that Newtek does not provide the necessary driver (NDI virtual input) for Mac! I had to search for the comments of the forum to find it after trying everything! Don't waste your time or money if you are on a Mac! I used This for 3 weeks now with OBS. It has a consistent latency of 1300 ms on my rig. Once the external audio interface has been set with the correct delay, it was fantastic. The video has from a small one at the beginning and remained Very disappointed. I put the wifi in modal It is low data and that has completely correct it. I use it at 1080 without the audio ndi. I can't thank you enough for this. Impeccable. The NDI tool that you have to transmit from your iPhone to your Mac is the virtual input NDI. This tool is not currently available for Mac, so there is no way to transmit your iPhone cam videos in the apps you use (zoom, teams, skype etc.). It would be nice to know before downloading the tools and go through the whole configuration. Needless for iPhone Mac Combo. I wanted to use it for a Skype zoom / webcam for my new Mac Mini - No Go. You can use the NDI Monitor software to view / listen to the feed but no way to integrate it in the app like zoom. I imagine that if you are a Windows user might be a good option, but don't waste your time if you are a Mac user. It ran all types of tests with this App connected to the OBS. Never had a problem. Tonight I wanted to use it to add a camera to a livestream. Again, I tested this. Refused to work and there was no way to know why. The app works as advertised. But for $ 19.99 I was incredibly disappointed to discover their logo permanently displayed in my videos. I would expect this for a free version, but not a paid app. This inconvenience limits how to use the app. It is not barely served for professional recordings, weddings, significant events, church services, etc. I will look for another product and look for a refund. Decided to experiment and I took a port of Belkin Lightning to Ethernet adapter to work together with an iPhone 11 Pro while using this app ... works perfectly in presenting themselves in VMIX as a NDI source 4K video guide in our productions ... we would like to see remote control options and support for different frame rates in a future iteration ... This app was built and if you use it for this purpose it's excellent. I downloaded the app, I launched it, opened the liveStream study and added an NDI input and the camera feed was detected immediately and looked crystalline. Blows the LiveStream LiveStream remote control Outside the water. My home wifi is so so and the feed was stable. Thank you very much for the app. You Rock guys! The App Camera for iPhone is fine, since it controls the internal cameras. But there is a utility that is missing from the pack of Mac tools included in Windows: NDI Virtual Input. Without this, it is not possible to use the camera output in third-party apps as a zoom. So yes, you can towering in your MacBook or other MacOS device, but it's strictly in a way; You can still not use via other apps. This new app, capable of 4K clearly puts clearly the three main competing apps in the bathroom. Impressive and totally compatible performance with Ecamm and others. A +++! I went through every other NDI app (free app) with very little fortune gaining a stable and high-definition source for the OBS. The flow configuration with the supplied tools was effortlessly and made me just used to go through the process once. I'm going to update the Pay Asap app and will be faithful to this developer. The app is not clear and confusing without help or instructions. There is no direction on which you need to install the five MacOS downloads to use the Camera App as a video source in E.G. Enlarge. Rather technological results are kind but the usability is not there. lÂ
